Problem Definition

Problem Statement

Given a series of data describes the property's **features**

Output the reasonable/best **price** point for the host.

Figure 4 Problem Basic Solving Method

Figure 4 Problem Basic Solving Method

$$f(\textit{Capacity}, \textit{Location}, \dots, \textit{RoomType}, \textit{ReviewScore}) + \beta_0 \Rightarrow \textit{Price}$$

State-of-the-Art

Table 1 A brief review of the literature on price influencing factors

Dimension	Factors	Effects	Author
External	Price in cities	N/A	Stephen and Andrew(2016) Balaguer and Pernias(2013), Becerra(2013) Bull(1994), Wang & Nicolau(2017), Li (2016), Huang(2010) Wang & Nicolau(2017), Zhang(2017)
	Number of owners Distance between owners	Pos/Neg	
Location	Distance	Negative	
House	Room type	Negative	
	Room type	Positive	
Room	Bedroom, bathroom, bed	Positive	
Rule	Instant bookable	Negative	
	Cancellation policy	Positive	
Sociality	Number of reviews per year	Negative	
		Positive	
	Host identity verified	Pos/Neg	
		Positive

Get Data

Raw_Data-Airbnb-Beijing.csv

Total:
19360 Listings

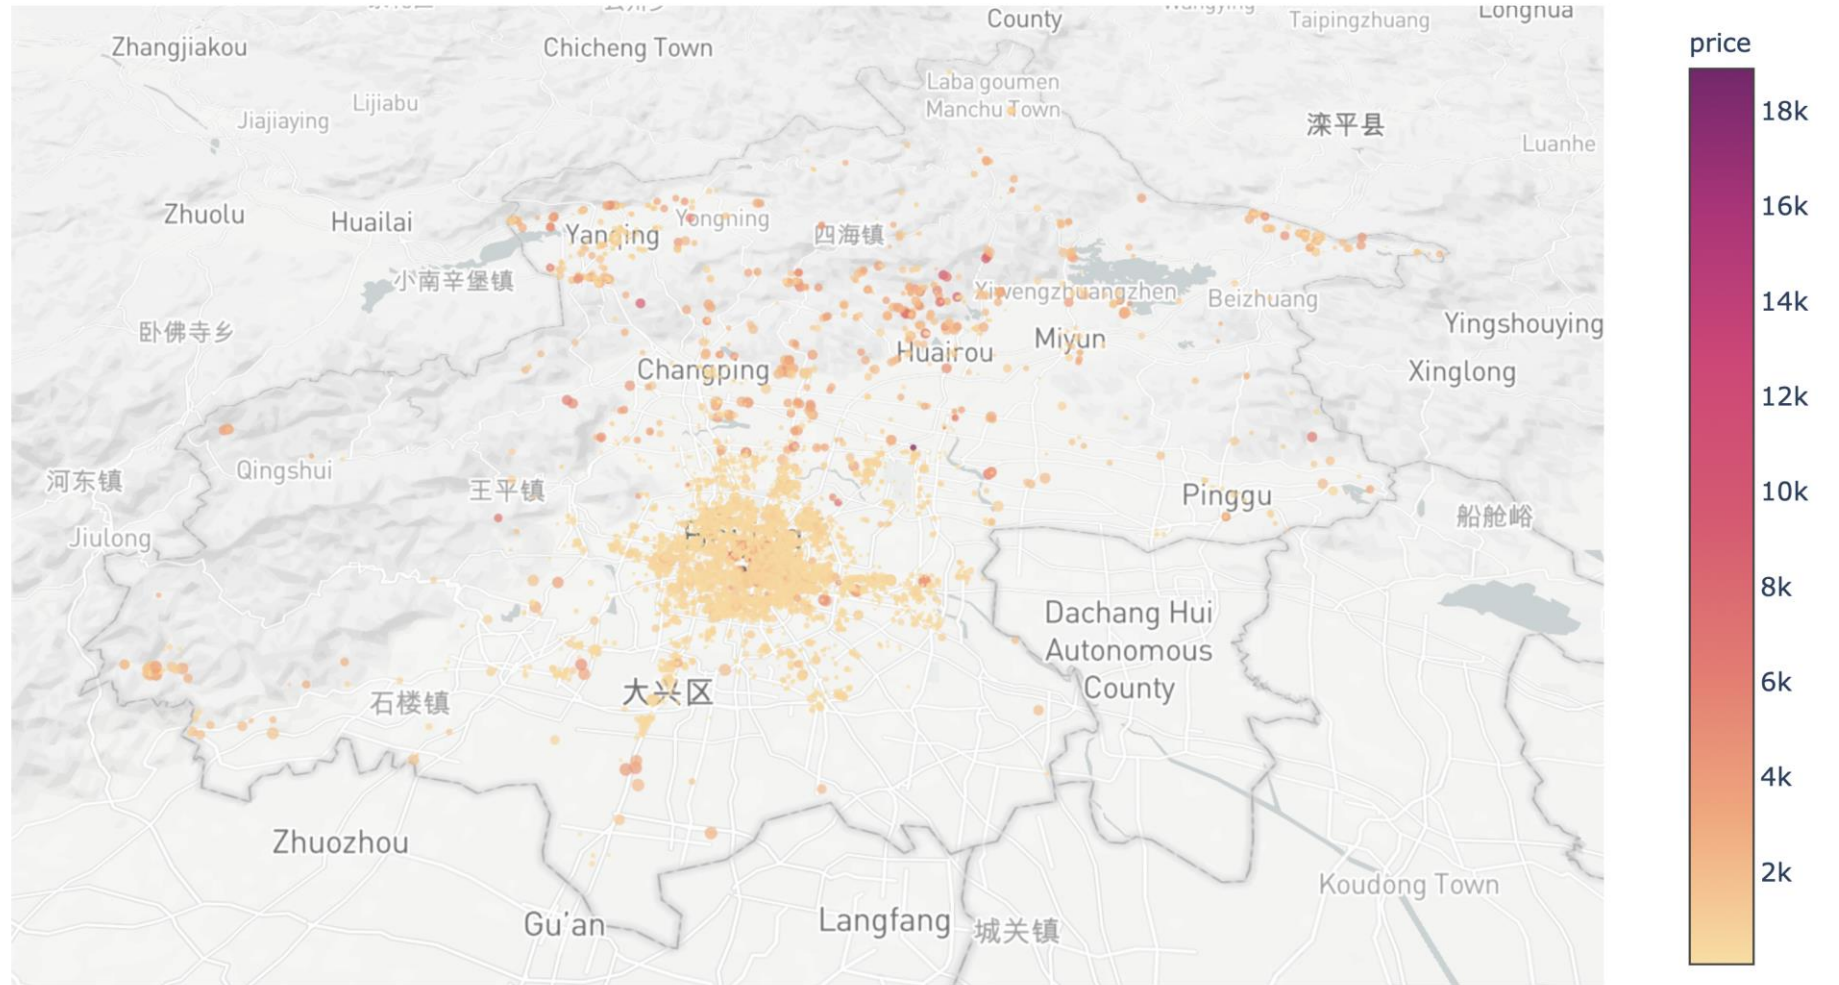

Figure 6 All available Data in Airbnb

Data Pre-Processing

- Drop Properties that **lacks too many features** (less than 100)
- Drop outliers handpicked via inspection (i.e. Check the Actual ID on www.airbnb.com)
- Drop Properties with **unreasonable prices** (i.e. the host didn't actually want to Airbnb it)

~~[Price < (50 * accommodates) OR (50 * beds)]~~

~~[Price > 20,000 OR Price = 9999]~~

~~[beds=50 OR bathrooms=101 OR min_nights > 3]~~

- Fill up a few fixable nulls.

Feature-Based Airbnb Price Prediction

Table 4 Actual Performance

Model Name	R ² Score	Prediction
Random Forest	0.705	¥ 1798.06
Artificial Neural Network	0.712	¥ 1820.95
Gradient Boosting	0.745	¥ 1882.24
eXtreme Gradient Boosting	0.746	¥ 1887.61

Beijing

🏠 Entire house

12 guests 6 bedrooms 6 beds 2 baths

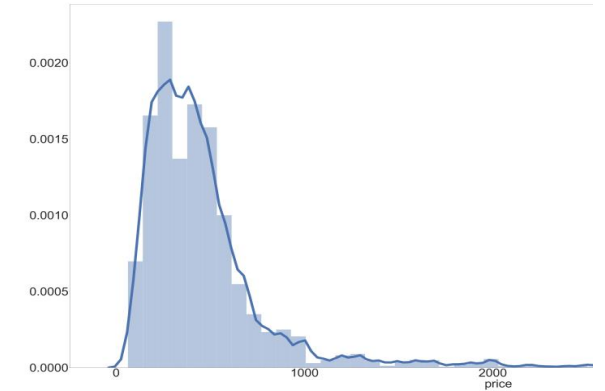

**¥ 1,888** per night

Error Analysis

- Expensive listings have **less** data than cheap listings

- Feature isn't everything for price.**

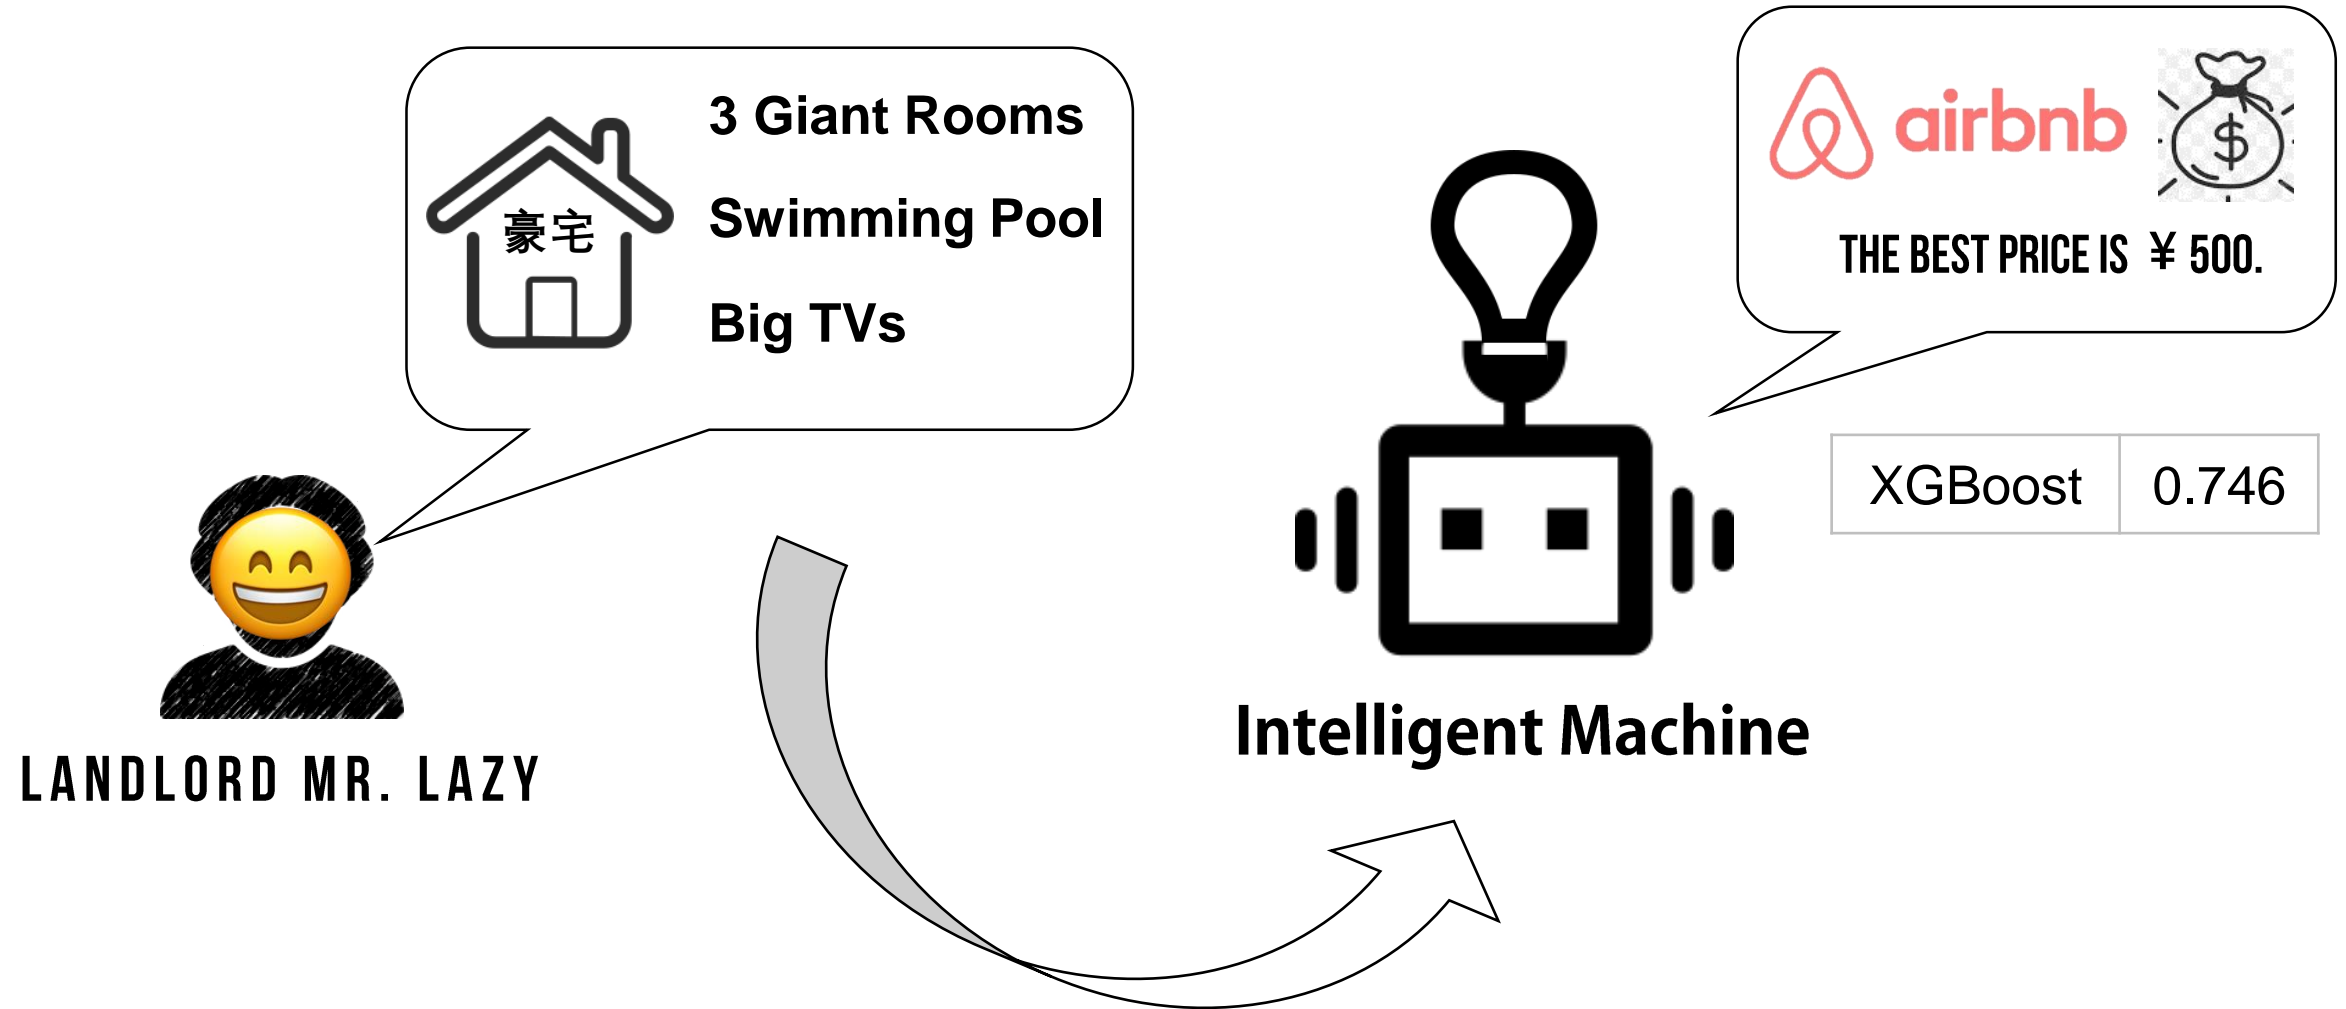

¥ 200

¥ 2348

To wrap up,

Thank you!
